OPERATIONAL FORENSIC AUDIT

sdvs

Prepared for **asdaFa** • 12/15/2025

AUDIT REFERENCE
#156B40DB

Capital Leakage Detected
Estimated annual operational waste based on current workflow.

₹72000
ANNUAL IMPACT

Factory Forensic Health Report

SECTION 1: THE FINANCIAL BLEED

The Verdict

Your factory is currently operating in the **Green Efficiency Zone**. However, this assessment does not account for the significant operational vulnerabilities identified, which, if left unaddressed, could rapidly escalate your financial exposure.

Dead Capital Analysis

While our analysis detected **₹0 in dead capital**, indicating effective utilization of your current capital, you are currently incurring **₹0/month** in pure interest. This is not a business expense; it is a penalty.

Operational Waste

Your total annual leakage from operational waste is **₹72,000**. That is the cost of **Growth Capital** that you are throwing away every year. This seemingly small figure is a critical indicator of deeper, unquantified process inefficiencies.

SECTION 2: CRITICAL RISK DIAGNOSIS

Despite the 'Green' efficiency rating, a deeper dive into your operations reveals several high-stakes vulnerabilities that are silently eroding your profitability and stability:

The "Bus Factor" is a Reality: Your entire store operation is a single point of failure. With your store manager being the sole repository of inventory knowledge ("Disaster. He knows where everything is kept"), you don't own a business; you own a chaos engine dependent on one person. This is a critical vulnerability that can halt your entire production if this individual is unavailable.

Financial Guesswork, Not Strategy: Operating without formal Bills of Material (BOMs) and relying on "Mental Math" for costing is a recipe for financial leakage. You are making critical pricing and purchasing decisions based on guesswork, leading to inaccurate quotes, material over-ordering, and missed profits. This also means you are likely ordering materials you already have, tying up valuable cash in unnecessary inventory.

Weekly Production Stoppages: Weekly line stoppages are a direct hit to your productivity and delivery schedules. Each occurrence means lost production time, idle labor, and delayed orders, directly impacting your bottom line and customer satisfaction. This indicates fundamental issues in planning, material availability, or maintenance.

Alarming Return Rate: A return rate exceeding 5% is a serious red flag for quality control and process consistency. This translates directly into rework costs, material waste, customer dissatisfaction, and potential loss of future business. This is a direct financial drain that needs immediate attention.

SECTION 3: THE F3 BLUEPRINT

To stop the bleeding of **₹72,000** annually, and more importantly, to mitigate the catastrophic risks currently unquantified, here is your immediate action plan:

Your primary objective, accurate production costing, can be immediately addressed by deploying the **F3Next Costing Module**. This will formalize your BOMs, track material consumption precisely, and give you real-time visibility into your true production costs. This foundational step will also pave the way to tackle inventory chaos, reduce stoppages, and improve quality.

Deploy your instance to stop this loss today.
